

Setting the Cyrillic character set in Chrome and Firefox

The preferred web browser for this site is Chrome, although Firefox can work with some effort

In **Chrome**, click on the three vertical dots in the top right corner,

- Select More Tools
- Select Extensions, then Get More Extensions (if you see it)
- Select the extension named Charset
- Click +Add to Chrome
- Add Extension

After setting the Charset extension, in the browser window, right click (PC) or control click (Mac), from the menu select Charset and then the desired character set (Cyrillic ISO) from the drop down list.

In Firefox, you need to set the character set to Cyrillic (ISO). This allows the Cyrillic text to display properly in Firefox, however it needs to be set each time you load another page containing Cyrillic characters.
